

Car seat safety

- Your child should always travel in a restraint that is the right size for their height.
- Use the shoulder-height indicators on the restraint to check if your child has outgrown it.
- Five-point harnesses are safest until your child is too tall for the restraint. A booster seat is then needed until they are at least 145cm tall.
- It is recommended children under 12 years sit in the back seat as it offers more protection to passengers.
